Snow leopard

Felis uncia was the scientific name used by Johann Christian Daniel von Schreber in 1777 who described a snow leopard based on an earlier description by Georges Louis Leclerc, Comte de Buffon, assuming that the cat occurred in Barbary, Persia, East India, and China. *Uncia* was proposed by John Edward Gray in 1854 who grouped Asian cats with a long and thick tail into this genus.

The snow leopard *Panthera uncia*, also known as the ounce, is a large cat native to the mountain ranges of Central and South Asia. It is listed as Vulnerable on the IUCN Red List because the global population is estimated to number less than 10,000 mature individuals and is expected to decline about 10 percent by 2040. It is threatened by poaching and habitat destruction following infrastructural developments. It inhabits alpine and subalpine zones at elevations from 3,000 to 4,500 m 9,800 to 14,800 ft , ranging from eastern Afghanistan to Mongolia and western China. In the northern range countries, it also lives at lower elevations. Taxonomically, the snow leopard was long classified in the monotypic genus *Uncia*. Since phylogenetic studies revealed the relationships among *Panthera* species, it is considered a member of this genus. Two subspecies were described based on morphological differences, but genetic differences between the two have not been confirmed. It is therefore regarded a monotypic species.

The cheetah occurs mostly in eastern and southern Africa; presence in Asia is limited to the central deserts of Iran, though there have been unconfirmed reports of sightings in Afghanistan, Iraq and Pakistan in the last few decades.

Before 2003, the total wild snow leopard population was estimated at 4,080 to 6,500 individuals. In 2016, the global population was estimated at 4,678 to 8,745 individuals, suggesting that the total number of snow leopards was larger than previously thought.
